

# Power Goals for NASA's Exploration Program

J. Jeevarajan, Ph.D.

NASA-JSC, Houston, TX

J. Jeevarajan, Ph.D. / NASA-JSC

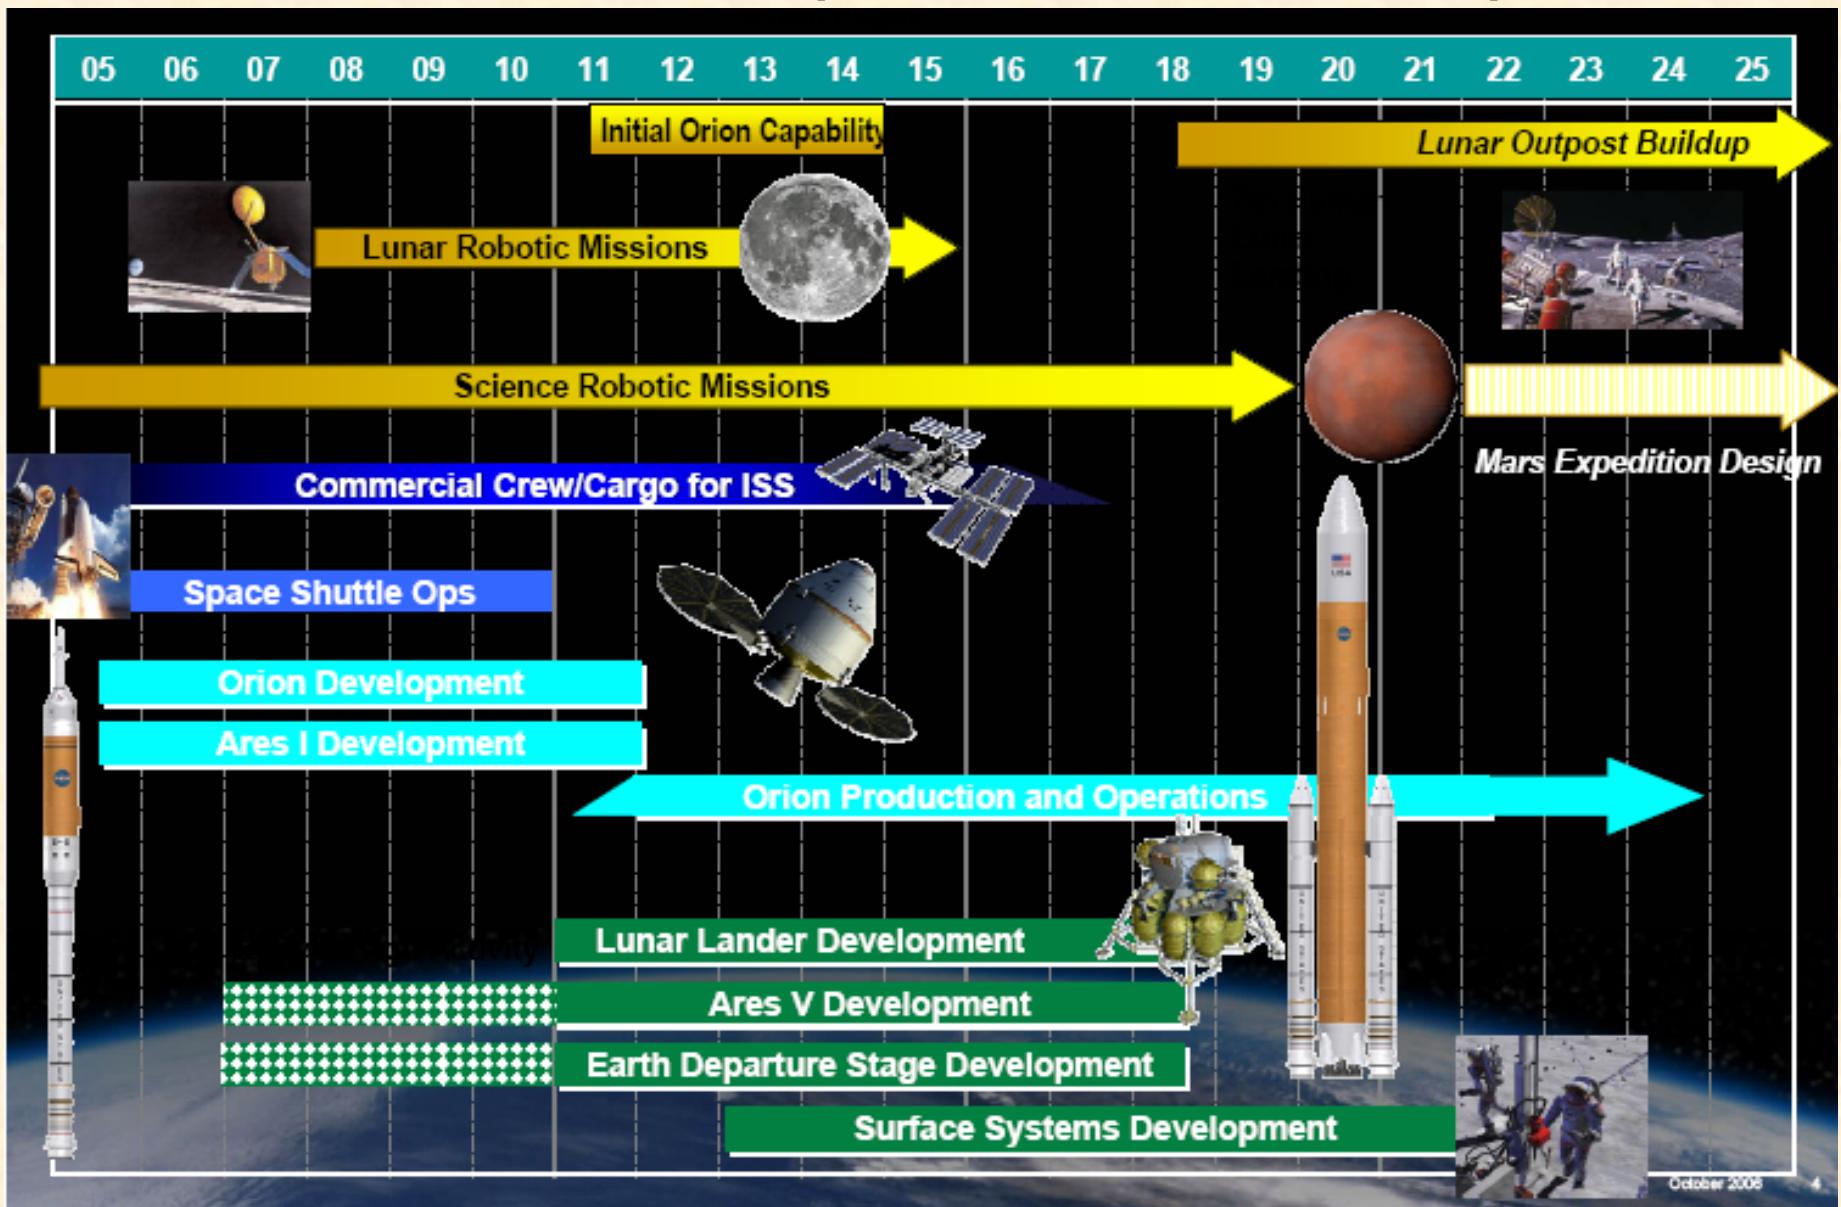

# Outline

- Exploration Program
- Power Needs (Customers)
- Safety for Manned Space Missions
- Technology Programs to Achieve Safe Power Goals
- Collaborative work
- Summary and Conclusions

# Exploration Program

# NASA'S Exploration Roadmap

October 2008

# Our Exploration Fleet

## *What Will the Vehicles Look Like?*

Earth Departure Stage

Ares V  
Cargo Launch  
Vehicle

Orion  
Crew Exploration  
Vehicle

Altair  
Lunar  
Lander

Ares I  
Crew Launch  
Vehicle

# Building on a Foundation of Proven Technologies

## - Launch Vehicle Comparisons -

# Ares 1-X

# Ares 1-X

# Ares I

- ◆ Serves as the long term crew launch capability for the U.S.
- ◆ 5 Segment Shuttle Solid Rocket Booster
- ◆ New liquid oxygen / liquid hydrogen upperstage
  - J2X engine
- ◆ Large payload capability

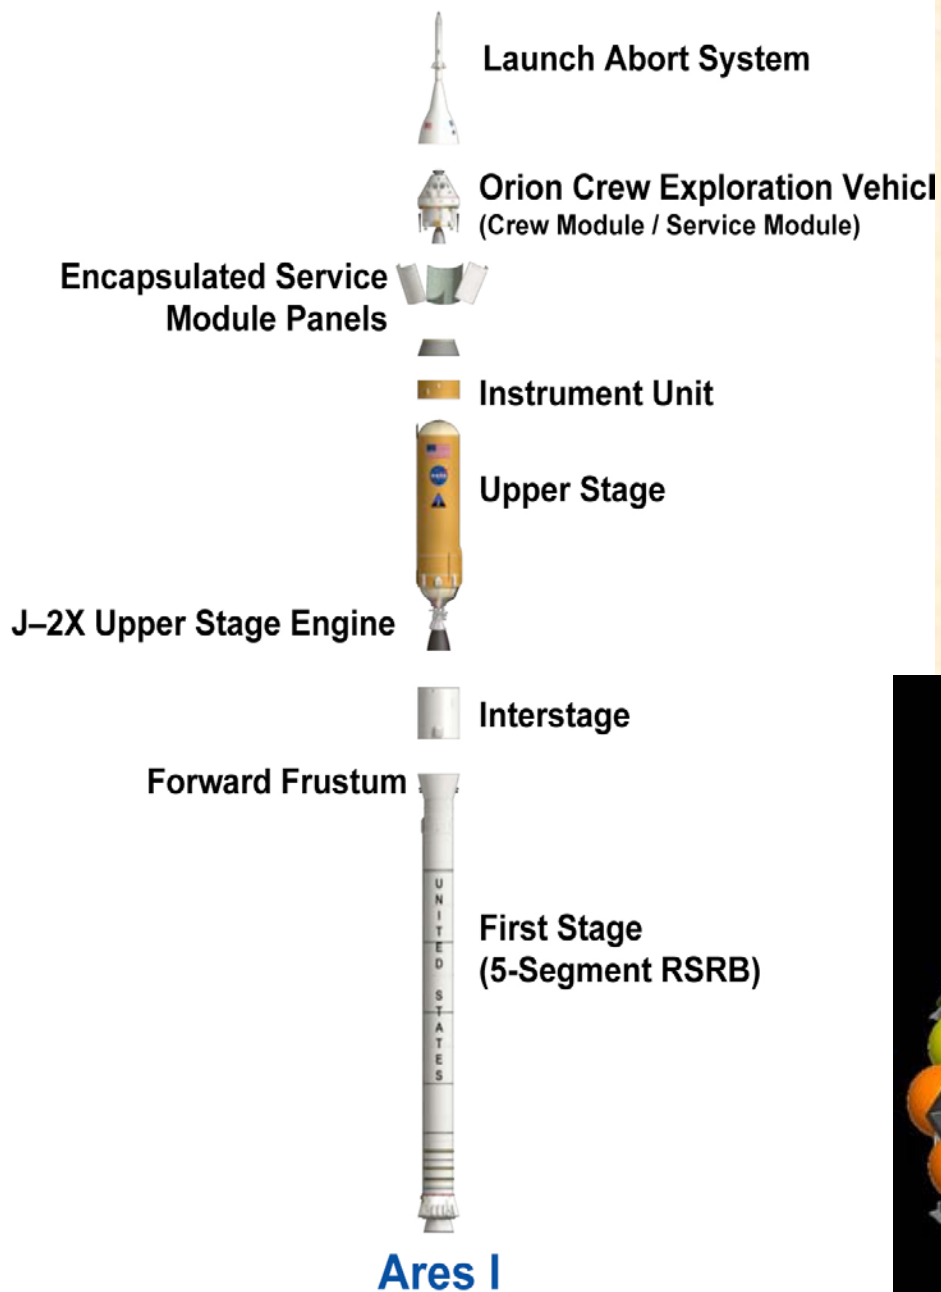

# Orion CEV and ISS

- ◆ **Transport up to 6 crew members on Orion for crew rotation**
- ◆ **210 day stay time**
- ◆ **Emergency lifeboat for entire ISS crew**
- ◆ **Deliver pressurized cargo for ISS resupply**

# Typical Mission Sequence

# Ares V

- ◆ **5 Segment Shuttle Solid Rocket Boosters**

- ◆ **Liquid Oxygen / liquid hydrogen core stage**

- Heritage from the Shuttle External Tank
- RS68 Main Engines

- ◆ **Payload Capability**

- 106 metric tons to low Earth orbit
- 131 Metric tons to low Earth orbit using Earth departure stage
- 53 metric tons trans-lunar injection capability using Earth departure stage

- ◆ **Can be certified for crew if needed**

Composite Payload Shroud

Altair Lunar Lander

Earth Departure Stage  
 LOx/LH<sub>2</sub>  
 1 J-2X Engine  
 Al-Li Tanks  
 Composite Structures

Loiter Skirt

Composite Interstage

Core Stage  
 LOx/LH<sub>2</sub>  
 6 RS-68B Engines  
 Al-Li Tanks  
 Composite Structures

2 5.5-Segment RSRBs

# Ares V

Earth Departure Stage with Altair and CEV

# Altair Lunar Lander

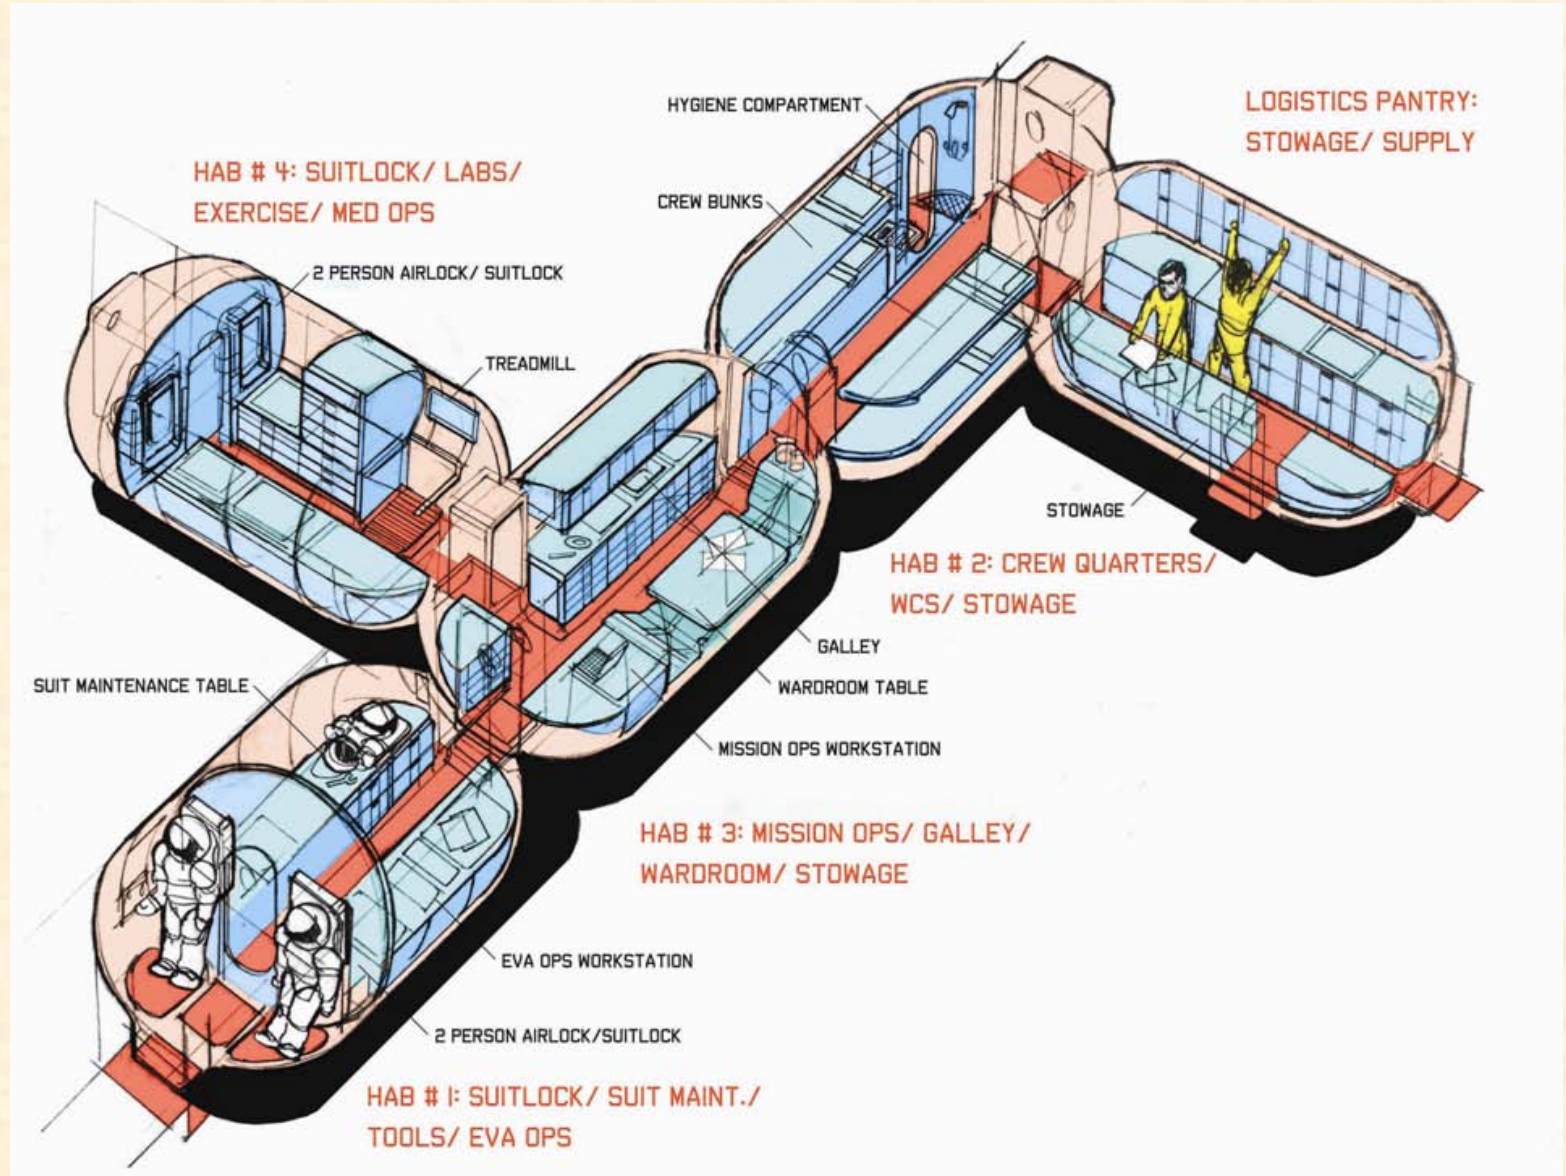

- ◆ **Transports 4 crew to and from the surface**
  - Seven days on the surface
  - Lunar outpost crew rotation
- ◆ **Global access capability**
- ◆ **Anytime return to Earth**
- ◆ **Capability to land 20 metric tons of dedicated cargo**
- ◆ **Airlock for surface activities**
- ◆ **Descent stage:**
  - Liquid oxygen / liquid hydrogen propulsion
- ◆ **Ascent stage:**
  - Storable Propellants

# Lunar Mobility

# Lunar Outpost

# Lunar Missions

- ◆ Regaining and extending operational experience in a hostile planetary environment
- ◆ Developing capabilities needed for opening the space frontier
- ◆ Preparing for human exploration of Mars
- ◆ Science operations and discovery

# Lunar Surface Systems (Mobility)

## Pressurized Rover

Preliminary Power Requirements:  
**Safe**, reliable operation  
>150 Wh/kg at battery level  
~ 500 cycles  
Operation Temp: 0 to 30 °C  
Maintenance-free operation

# Altair Lunar Lander Ascent Module

**Preliminary Power Requirements for Minimum capability (no redundancy):**

- **Safe, reliable operation**
- **14 kWh energy, delivered**
- **1.67 kW average and 2 kW peak power**
- **Mass allocation: 67 kg**
- **Volume allocation: 45 liters**
- **7 hours continuous operation**
- **1 cycle**
- **Operation over 0 – 30 degrees C**
- **Operation in 0 – 1/6 G**

## **Ascent Stage: Batteries**

(Current baseline is Primary Lithium Battery with plan to change to rechargeable Li-ion)  
Required to provide contingency power for descent stage and translunar insertion; expect peak power growth; Rechargeable provides greater ability to test before flight.

## Extravehicular Activity (EVA) Suit Lunar EVA 2<sup>nd</sup> Configuration

### Enhanced Helmet Hardware:

- Lighting
- Heads-Up-Display
- Soft Upper Torso (SUT) Integrated Audio

## Power / Communications, Avionics & Informatics (CAI):

- Cmd/Cntrl/Comm Info (C3I)
- Processing
  - Expanded set of suit sensors
  - Advanced Caution & Warning
  - Displays and Productivity Enhancements

Video:  
Suit Camera

**PLSS:**

Fan, pump, ventilation  
subsystem processor; Heater,  
controllers, and valve

## Enhanced Liquid Cooling Garment:

- Bio-Med Sensors

## Preliminary Power Requirements:

- Safe, reliable operation
- 1155 Whr energy, delivered
- 145 W average and 233 W peak power
- Mass allocation: 5 kg
- Volume allocation: 1.6 liters
- 8 hour operation per sortie
- 100 cycles (operation every other day for 6 mos.)
- Operation over 0 – 30 degrees C

### Current Suit Batteries:

EMU: 20.5 V; min 26.6 Ah (7 hr EVA), 9A peak, 5 yr,  
<15.5 lbs, 30 cycles

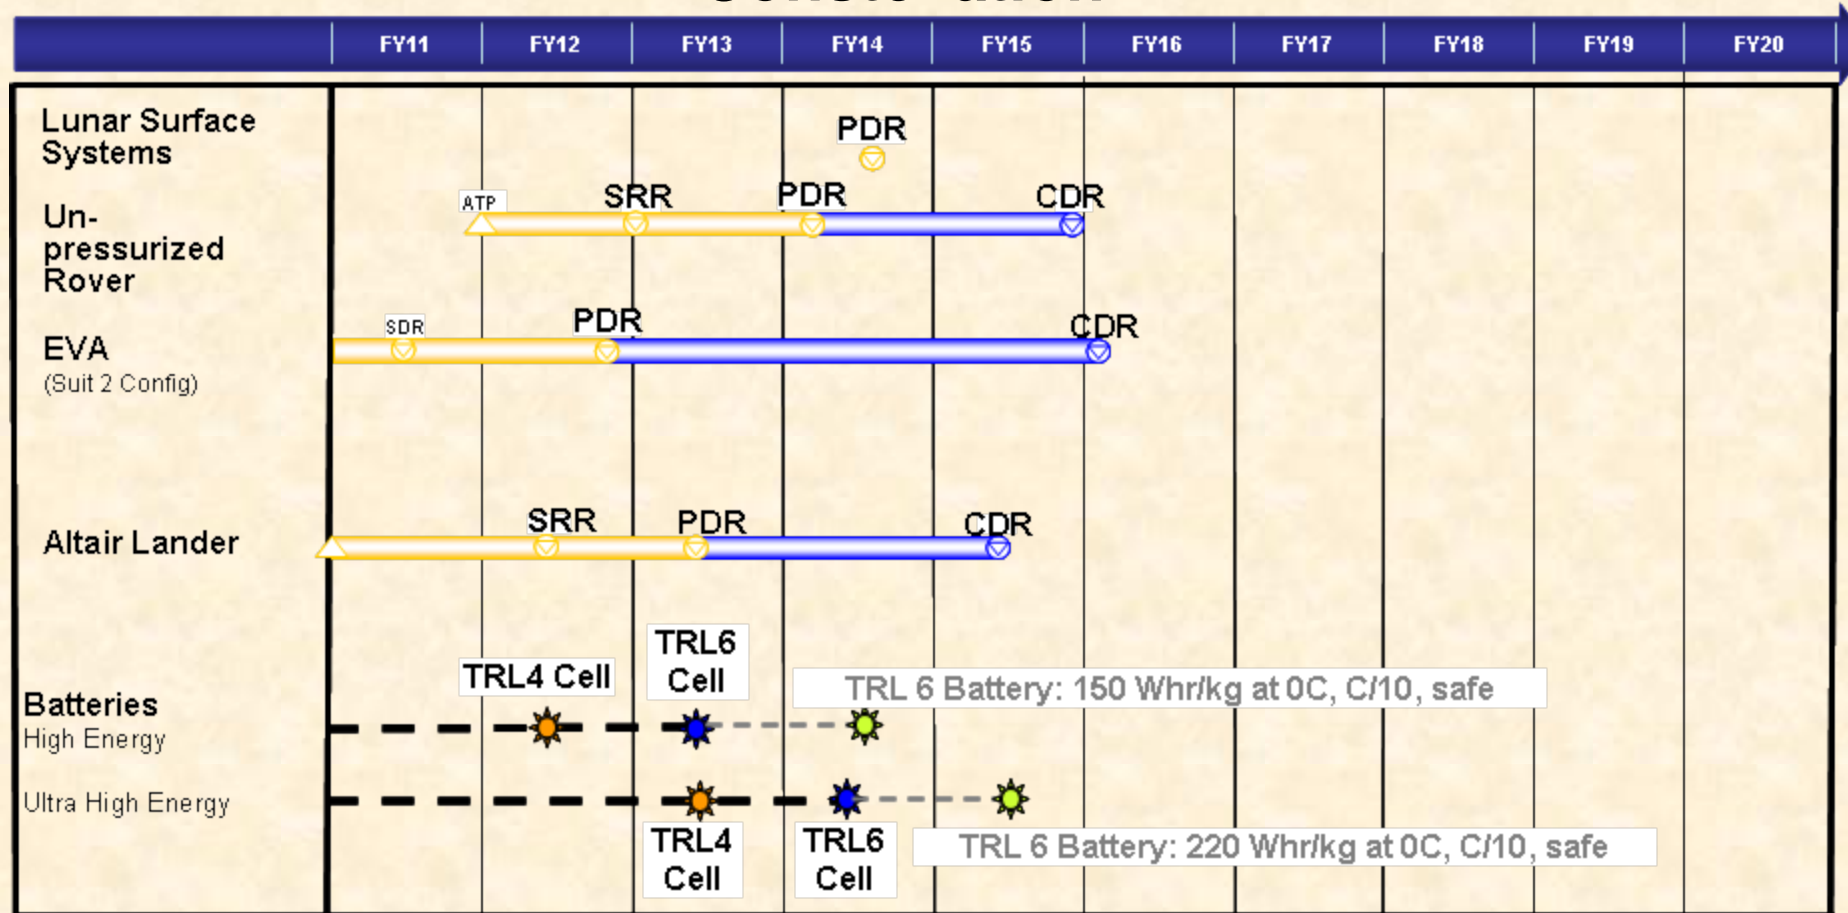

SAFER:42 V; 4.2 Ah (in emergency only)

REBA: 12.5 V, 15 Ah, (7 hr EVA); 5 yr, ~6 lbs

EHIP: 6 V, 10.8 Ah; (7 hr EVA); 5 yr, ~1.8 lbs

# Exploration Technology Development Program (ETDP)

## Energy Storage Battery Development Schedule for Constellation

**PDR: Preliminary Design Review**  
**CDR: Critical Design Review**  
**SRR: System Requirements Review**  
**TRL: Technology Readiness Level**

# Key Performance Parameters for Battery Technology Development

Customer Need	Performance Parameter	State-of-the-Art	Current Value	Threshold Value	Goal
<b>Safe, reliable operation</b>	No fire or flame	Instrumentation/controllers used to prevent unsafe conditions. There is no non-flammable electrolyte in SOA	Preliminary results indicate a moderate reduction in the performance with flame retardants and non-flammable electrolytes	Benign cell venting without fire or flame and reduce the likelihood and severity of a fire in the event of a thermal runaway	Tolerant to electrical and thermal abuse such as over-temperature, over-charge, reversal, and external short circuit with no fire or flame
<b>Specific energy</b> <u>Lander:</u> 150 – 210 Wh/kg 10 cycles  <u>Rover:</u> 150 – 200 Wh/kg  <u>EVA:</u> 200 – 300 Wh/kg 100 cycles	<b>Battery-level</b> specific energy*	90 Wh/kg at C/10 & 30 C 83 Wh/kg at C/10 & 0 C (MER rovers)	130 Wh/kg at C/10 & 30 C 120 Wh/kg at C/10 & 0 C	<b>135 Wh/kg</b> at C/10 & 0 C “High-Energy”** <b>150 Wh/kg</b> at C/10 & 0 C “Ultra-High Energy”**	<b>150 Wh/kg</b> at C/10 & 0 C “High-Energy” <b>220 Wh/kg</b> at C/10 & 0 C “Ultra-High Energy”

Assumes prismatic cell packaging for threshold values. Goal values include lightweight battery packaging.

\* Battery values are assumed at 100% DOD, discharged at C/10 to 3.0 volts/cell, and at 0°C operating conditions

\*\* “High-Energy” = Exploration Technology Development Program cathode with MCMB graphite anode

“Ultra-High Energy” = Exploration Technology Development Program cathode with Silicon composite anode

# ETDP Li-ion Cell Development

- **Component-level goals** are being addressed through a combination of NASA in-house materials development efforts, NASA Research Announcement contracts (NRA), and grants
- Materials developed will be delivered to NASA and screened for their electrochemical and thermal performance, and compatibility with other candidate cell components
- Other activities funded through NASA can be leveraged – NASA Small Business Innovative Research (SBIR) Program and Innovative Partnership Program (IPP)
- Leveraging off other government programs (DOD, DOE) for component-level technology
- Leveraging off other venues through Space Act Agreements (SAA) that involve partnerships with industry partners such as Exxon; non-profit organizations such as Underwriters Laboratory (UL), etc.

## **Safety Component Development Led by NASA JSC (Judy Jeevarajan)**

- Development of internal cell materials (active or inactive) designed to improve the inherent safety of the cell
- Functional components designed to shut down cell in case of overcharge, over- current, or over-temperature
- Standardize safety test methodologies

# Current State for Safety of Li-ion Batteries

Although the chemistry is one that can provide very high energy density at this time, it is not the safest

- NASA human-rated safety requirement is two-fault tolerance to catastrophic failures – leakage of electrolyte (toxicity hazard), fire, thermal runaway

Hazards encountered during

- Overcharge/overvoltage
- External shorts
- Repeated overdischarge with subsequent overvoltage
- High thermal environments
- Internal Shorts

# Overcharge of Battery Module

**Charge: C/5  
To 4.4 V/Cell  
Overcharge limit:  
5.5 V/Cell  
Thermal runaway  
after 4.8 V/Cell  
Highest temp  
Observed before  
thermal  
runaway: 248 °C**

**41S 5P**

# Overcharge of Li-ion Cell Module

# Current Separators in Commercial-off-the-Shelf Li-ion Cells

**Unactivated Separator**

**Activated Separator**

**Shut-down temperature is very close to temperature at which initiation of thermal runaway occurs.**

# SafeLyte<sup>®</sup> Additive (IPP)

# **Composite Thermal Switch (SBIR)**

**Now: 2009 ETDP NRA (NASA Research Announcement)**

**Giner Inc.**

**Development and demonstration of a composite thermal switch for lithium-ion and lithium primary batteries to increase the safety of these batteries by an increase in resistance at high temperatures.**

## **Coating for Improved Cathode Safety (2009 ETDP NRA)**

**Physical Sciences Inc.**

**Development and demonstration of a nanomaterial coating over the traditional cathode particles to improve performance and safety.**

# Screening for Internal Shorts

- NASA –JSC uses vibration method for screening against cell internal shorts.
- Other methods used that can provide screening for internal shorts are X-rays and CT scans.
- NASA-JSC also uses a crush test method for determining the tolerance of a cell chemistry /design to internal shorts.
- Foresee collaboration with UL in the near future to standardize the method for determining tolerance of li-ion cells to internal shorts.

# Summary

- Exciting Future Programs ahead for NASA
- Power is needed for all Exploration vehicles and for the missions.
- For long term missions as in Lunar and Mars programs, safe, high energy/ultra high energy batteries are required.
- Safety is top priority for human-rated missions
  - Two-fault tolerance to catastrophic failures is required for human-rated safety
- To meet power safety goals - inherent cell safety may be required; it can lessen complexity of external protective electronics and prevents dependency on hardware that may also have limitations.
- Inherent cell safety will eliminate the need to carry out screening of all cells (X-rays, vibration, etc.)
